Atharva Veer - *Frontend Lead*
Ivan Ramos - *Backend Lead*
Keon Abbasi - *Scrum Master & Frontend Support*

Michael Petrossian - *Git Master & Backend Support*

Maël Teyssèdre - *Backend Support*
Kevin Zeng - *Frontend Support*

Section: 04   Team:04   Date: April 20, 2023

1. *UI and Functionality Feedback:*

Instructors Feedback:
- Have the messages integrated to clearly show the text chain between the user and the Employee
  - Clean up the UI to make the messages visually simple to view
- Create components for Dashboard to switch between functionalities
- Video needs to be able to connect both user and Employee
  - Create a component for the video tab to clean up UI functionality

Plan for comments:
- Have the front end clean up the dashboard

- ○ the side tabs become components
- ○ Add the backend functionality to each respected component
  - ■ I.e. message functionality -> message tab
- Once the functionalities are integrated front end will style the dashboard to make a visually pleasing and simple UI to follow and understand

2. *List of P1 features committed for delivery:*

- **R1.2.0 - priority HIGH:** Customers and specialists can register and login, as well as logout, using a different interface for each respective type of user. This feature allows customers and specialists to access their account and personal information based on their roles. For example, during registration, a specialist will provide their personal information like name, and age, but also provide their area of expertise. All of the information will be available in the respective profile homepage, where the user will be routed to after login.

- **R2.2.0 - priority HIGH:** Customers can upload their resume to their profile.

- **R3.2.0 - priority HIGH:** Users can follow/add specialists that they feel will assist them in their journey. Once a specialist is selected they **may** appear in their Connections dashboard feature, where the user can message, schedule or join a video call with. Specialists will have the choice to either accept or deny a customer that requests a connection.

- **R4.2.0 - priority HIGH:** Customers and specialists are able to exchange messages with each other **after they have made a connection**. Messages will be permanently stored in the database. That way, the 2 users can enjoy a real-time, persistent chat. Their questions and feedback can be exchanged through there and each user will be able to access their messages from their own profile dashboard.

- **R5.2.0 - priority MEDIUM:** Both types of users can edit their profile information under the settings tab in their profile dashboard.

- **R6.2.0 - priority MEDIUM:** Employees and users can join a video call with each other if they have a connection. The scheduling of the video currently is planned so that the user and employee can plan on a time to join a call together.

3. Risks:

- Not being able to implement functionality in time due to lack of understanding or difficulty.
    - Solution: Researching how to implement the tech and communication with the team. Teammates should be sharing what they are working on at every meeting, plus the progress made.
- Too much implementation per git commit
    - Solution: Add small changes per feature to avoid merge conflicts.
- Ensuring that each teammate is actually working on what they say they are or will. We do not want to be jammed at the end because somebody did not hold to their commitment.
    - Solution: Be direct and open with teammates about the Needs of the team and exactly what is needed and when.
